Intelligent Game Validation

Student challenge

> Can you test a third-party casino game the way a player would, without access to the game's DOM?

Context

Betsson integrates casino games built by external studios into its lobby, account and wallet. These games may render inside an iframe or canvas, making their controls, balances, messages and game-specific states difficult to inspect with conventional DOM-based automation.

Your solution must validate the visible player experience. A click on Spin is not proof that the integration worked.

Your challenge

Build a proof of concept that navigates the Betsson casino experience, launches a Pragmatic Play game in Real Play, and validates the two journeys below using what is visible on screen.

> **Freedom of approach.** You choose the technology and architecture. Computer vision, OCR, image recognition and AI-driven UI interaction are possible approaches, but none is mandatory. Whatever method you choose must verify the actual player-visible result rather than rely only on hard-coded clicks.

Scope and safeguards

- Use any Pragmatic Play game available in the market being tested. No specific title is required.
- Test users have been created and funded. Betsson will provide them separately.
- Do not include credentials or secrets in the repository, report, screenshots, recordings or presentation.
- Use the appropriate language, currency and market configuration for each test.

Scenario 1 — Completed Real Play spin

1. Open the Betsson casino lobby for the target market.
2. Authenticate with the supplied funded test account.
3. Launch any Pragmatic Play game available in that market and enter Real Play.
4. Read the Betsson balance before the spin. Identify the displayed wager and currency.
5. Locate the controls inside the game and trigger a spin.
6. Verify from the screen that the game reacted and the spin completed.
7. Read the settled outcome and the balances after the spin.

What must be verified

- The spin actually started and completed. Clicking a control alone is not a pass.
- The displayed wager is the wager used for the spin.
- The displayed currency matches the target market.
- The in-game balance is consistent with the completed spin.

- The Betsson balance before and after the spin reconciles with the wager and observed payout.

> **Balance rule.** `balance after = balance before − wager + payout`
>
> Payout means the amount credited by the completed spin, based on the outcome observed on screen. The spin does not have to be a winning spin to pass.

Scenario 2 — Insufficient balance

Use a supplied test account in a state with no usable balance for the attempted spin. Coordinate with mentors on preparing this state.

1. Open the Betsson casino lobby for the target market.
2. Authenticate with the supplied test account.
3. Launch any Pragmatic Play game available in that market and enter Real Play.
4. Read the balance before attempting the spin.
5. Attempt a spin.
6. Verify the visible insufficient-balance response and read the balance afterwards.

What must be verified

- The attempted spin is rejected rather than completing as a paid spin.
- The player receives an appropriate insufficient-balance message in the expected language.
- The displayed currency matches the target market.
- The Betsson balance does not change.
- The in-game balance does not change.

The message may be rendered inside the provider game. Validate what the player actually sees.

Target markets

Run both scenarios on both markets, using the correct market configuration.

Site / market	Expected language	Expected currency
betsson.com	English	EUR
betsson.pe — Peru	Spanish	PEN (soles)

Deliverables

The following four deliverables are required. Additional work may earn bonus points but is not mandatory.

Deliverable	Required content
Code in a GitHub repository	The checker, clearly organised, with configuration for each market and no credentials or secrets. Specs, page objects, fixtures and utilities are examples of possible organisation, not a mandatory architecture.
GitHub Actions workflow	A workflow that runs both scenarios once per market and publishes the report.
Report and evidence	A pass/fail result for each check, identified by scenario and market, including the Betsson balance checks. Support results with screenshots, a trace or video.
Presentation — finalists only	A 7-minute presentation on 16 October showing a working run and explaining the team's technical choices.

Evaluation

Each criterion is scored from 1 to 5. Points awarded for each criterion are **(score ÷ 5) × weight**. The six criteria have a base maximum of 100 points.

Criterion	Weight	What a strong result demonstrates
Scenarios work	30	Both scenarios work on both markets, including the Betsson balance checks.
Sees like a player	20	Reads the visible screen and verifies the game's response rather than treating hard-coded clicks as proof. OCR, vision and AI are examples, not requirements.
Code and architecture	15	Clear, maintainable organisation suited to the chosen approach, configuration per market, and no secrets in the repository.
Report and evidence	15	Clear pass/fail results for each check, supported by screenshots, a trace or video.
GitHub workflow	10	Runs in GitHub Actions for each market and publishes the report.
Demo	10	A clear, working demonstration and an explanation of the team's choices.

> **Bonus: 0–10 additional points** for outstanding work not already covered by the six criteria. Each bonus award requires a written reason. The maximum total is 110 points.
>
> Keep the evidence player-centred: demonstrate not only that the automation clicked, but that the game reacted correctly, the expected message appeared when applicable, and the balance behaved as expected.

Challenge timing

When	What
15 October, 09:45	Company challenge briefing. The assigned classroom is published on Campus Virtual.
15 October, 10:15–20:00	Build window, with mentor support.
15 October, 21:45	Finalist teams announced on Campus Virtual.
16 October, 09:30	Finalist check-in at the Assembly Hall.
16 October, from 10:00	Finalist presentations at the Assembly Hall, 7 minutes per team.
